

ELCOME TO THE RPGTEX PACKAGE. This LATEX package is designed to allow users to flexibly typeset documents associated with Role Playing Games such as *Dungeons & Dragons* -- and many more besides. This packages defines a central engine: rpgcore which define a number of useful functions and classes, and a flexible set of themes which control how those commands are rendered in the final document.

#### Attribution & License

This package would not have been possible without the team who developed its predecessor, the `DND 5e LateX Template' . That code was released under an MIT license, the text of which can be found in the LICENSE file. rpgtex is released under the same license.

# PART I rpgtex Core

# Chapter 1: Installation & Usage

### Getting rpgtex

There are a number of different ways to acquire rpgtex. Once you have installed it, it is vital to ensure that it is properly configured (see below).

#### texmf Installation

The simplest way to use rpgtex is to install it on the texmf path, where the compiler can automatically find it:

git clone

https://github.com/DrFraserGovil/rpgtex.git "\$(kpsewhich -var-value TEXMFHOME)/tex/latex/rpgtex"

This will clone the repository into your LATEX path.

#### Indirect Installation

If you want to tinker with rpgtex -- such as by creating a new theme -- it is helpful to have it in a more accessible location. Clone the repository into a location of your choice:

git clone

https://github.com/DrFraserGovil/rpgtex.git ~/your/rpgtex/directory

You then have two options to make the package visible to the compiler:

#### Use TEXINPUTS

Setting the environment variable TEXINPUTS allows the compiler access:

TEXINPUTS=~/your/rpgtex/directory/::

(Or similar commands, depending on your shell -- in fish you would call set TEXINPUTS dir).

#### Use Symlinks

You can symlink the install location to the texmf directory, allowing the compiler to act as if you had performed the texmf installation:

ln -sf ~/your/rpgtex/directory "\$(kpsewhich
 -var-value TEXMFHOME)/tex/latex/rpgtex"

#### Overleaf (Not recommended!)

We do not recommend using Overleaf since the free-tier subscription has reduced compilation times drastically, making compiling documents using complex packages such as this one extremely difficult. Nevertheless:

1. Download this GitHub repository as a ZIP archive using the Clone or download link above.

- On Overleaf, click the New Project button and select Upload Project. Upload the ZIP archive you downloaded from this repository.
- 3. Manually create the file rpg-config.cfg with the contents ``\edef\RpgPackagePath{../}''. This replaces the configuration step described below.

## Configuring rpgtex

Wherever one installs rpgtex from, it is vital that it is properly configured. From within the rpgtex-root directory, call:

./configure

Or -- if one is (reasonably!) wary about running arbitrary executables -- manually create the relevant file:

cd <rpgtex root directory>
cmd="\edef\RpgPackagePath{\$(pwd)}"
echo \$cmd >> core/rpg-config.cfg

#### Why is configuration necessary?

TEX is generally set up so that when a file calls include or input it is possible to use filepaths relative to the package itself. rpg.sty can call \input{core/font.sty} and it will know to first check for the file relative to rpg.sty; even if the package resides within the texmf path and the user has no idea where rpgroot/rpg.sty, or rpgroot/core/font.sty, are.

An annoying exception to this is fonts and typefaces. xelatex searches for fonts based on *filepaths relative to* the current working directory -- or from those installed in as system fonts.

Since rpgtex includes several (license free) typefaces as part of the provided themes, this poses a problem. We must either require that:

- rpgtex documents can only be prepared in restricted locations relative to the install location of rpgtex.
- 2. Users must identify and specify the  ${\tt rpgtex}$  root path when preparing a document
- 3. Users must install the provided fonts to the system path
- 4. rpgtex must be configured to know `where it is', and so provide an absolute filepath to the internal fonts.

The Configuration step is the most portable and easiest-to-use of these options.

Without a core/rpg-config.cfg file, any document which includes rpgtex will fail to compile.

# Package & Class Usage

rpgtex can be used either as a standalone package, or as part of a number of classes

#### Standalone Package

The standalone package can be used directly by including the rpgtex package:

```
\documentclass{arbitrary-class}
\usepackage[options]{rpgtex}
\begin{document}
....
```

This will load only the core commands into the document, and (unless called explicitly) no themes will be imported. Using the package in this way does not activate any of the commands which change the overall geometry, background or headers of the document.

#### Classes

rpgtex can also be loaded through a number of classes which drastically alter the appearance of the document, defining new geometries backgrounds and adding headers

The provided classes are:

- 1. rpgbook (page 20). Based on the standard book class, this is designed for larger RPG documents.
- 2. rpghandout (page 21). Based on the article class, this is designed for shorter documents
- 3. rpgcard (page 22). A small-document class designed for creating modular `handout' cards for items, spells or abilities.

# Compiling

rpgtex uses the fontspec package to allow custom fonts, and therefore requires compiling with xelatex or luatex:

```
xelatex main.tex #works
luatex main.tex #works
pdflatex main.tex #fails
```

# Chapter 2: Main Engine

### ``Theme Commands''

Several commands in this documentation are described as **Theme Commands**. These are commands that the user is *not expected to call*, but which are executed by the internal engine in the process of rendering the page, or as a result of other commands that the user has called.

# A user who wishes to simply write documents using an unmodified rpgtex need only concern themselves with the User-Facing Commands.

On the other hand, these Theme Commands have been designed to provide a convenient interface for creating custom Themes -- and so their documentation allows for designers to create powerful and flexible themes from within rpgtex. Theme Commands can be split into two groups:

- 1. **Backend Commands** These are commands which are executed within a theme (or a class) to modify internal values, such as fonts and colors. A designer interacts with these commands by calling them.
- 2. Placeholder Commands These are virtual commands which are designed to be overwritten with completely custom code, which is executed when the core engine runs the command. A user interacts with these commands by redefining them (usually with RenewDocumentCommand).

A `theme' is therefore a collection of Backend Commands (to configure the `core engine') and redefinitions of Placeholder Commands to provide their own unique functionality.

### Title Pages

#### **User-Facing Commands**

\maketitle

{}

When called, creates theme-defined title pages using a custom format.

#### Syntax

```
\title {A title}
\subtitle {The subtitle} (optional)
\cover {path/to/image} (optional)
\author {Dr. W. Riter} (optional)
\begin {document}
\maketitle
....
\end {document}
```

#### Details

Calls either \RpgDrawCover or \RpgSimpleTitle depending on the value passed to RpgUseCoverPage.

If RpgUseCoverPage has been set to true (usually by a class such as rpgbook.cls), then the image stored in \@cover (if there is one) is automatically used as a full-page background image. This is independent of the theme definition of RpgDrawCover, and occurs before that function is called -- all subsequent drawing occurs over the top of the cover image.

\cover

{m} \@cover Saves an image path to the variable \@cover, automatically used by \maketitle as the background image.

#### Syntax

\cover {path/to/cover\_image}

#### Details

If RpgUseCoverPage has been set to true, then the image at this path will be used as a full-page image in the background of the page created by maketitle.

The default value is empty (\cover \{\}).

\subtitle

{m} \@subtitle

Saves a string to the variable \Osubtitle. Themes may use this when defining their RpgDrawCover and RpgSimpleTitle.

#### Syntax

\subtitle {<string>}

#### Details

This command has no effect on its own (unlike cover which is automatically included in the background).

The default value is empty (\subtitle {}).

#### Theme Commands

\RpgUseCoverPage

{m}

If true, maketitle creates a title page to populate, else the title is rendered as a heading.

#### **Syntax**

\RpgUseCoverPage {true/false}

#### Details

This is a Backend Command. When true, maketitle attempts to use \@cover and then calls RpgDrawCover. If false, it calls RpgSimpleTitle.

\RpgDrawCover

{}

Executes over the top of the \@cover image to render a front cover.

#### Details

This is a Placeholder Command, used by themes to customise the appearance of the title page which appears in rpgbook class. The default value renders a single node at the centre of the page containing \@title, \@subtitle, \@author and \@date variables in the centre. More advanced themes (such as dnd or scifi) add decorative embellishments and place the text at custom locations.

This command is executed by maketitle if \RpgUseCoverPage {true} has been set by the theme, class or directly by the user. The command is called from within an existing tikz environment with the remember, overlay options active, allowing for page coordinates (i.e. current page.north) to be used.

If a **\@cover** has been defined, this command is executed after the image is placed, drawing on top of it.

Renders a `header' title - a simple text-only title at the top of the page.

#### **Details**

This is a Placeholder Command, used by themes to customise the appearance of the title header which appears in rpghandout class. The default value places the title, subtitle and author at the top of the page. More advanced themes (such as dnd or scifi) add decorative embellishments and place the text at custom locations.

The Simple Title is configured so that, in a twocolumn document, it occupies the full page width; calling centering with the simple title therefore centers the text above both columns.

### Part Pages

\part \* part {o m}

Defines a wrapper around the standard part command that allows for tikz-based custom page formatting

#### **Syntax**

\part (\*)[<image>]{<part-name>}

#### Details

There are three distinct behaviours that can be exhibited, depending on the presence or absence of the \*, and the presence and value of <image>.

Command	Behaviour
\part *{partname}	Uses original part command defined by
<pre>\part *[<any text="">]{partname}</any></pre>	underlying class.
<pre>\part [none] {partname}</pre>	
\part {partname}	Calls RpgDrawPartPage on a blank background.
<pre>\part [path/to/image]{partname} </pre>	Places the corresponding image as a full-page
	background, and then calls RpgDrawPartPage.

RpgDrawPartPage (page 6) is a Theme Function, which executes a series of tikz functions to place the part title according to the theme specifications.

 $\RpgDrawPartPage \ \{m\}$ 

Uses Tikz to draw a custom part page when activated by \part (page 6).

#### Syntax

\RpgDrawPartPage {<part title>}

#### Details

This is a Placeholder Command, allowing the designed to determine where to place the part name on the page, and what embellishments accompany it. The command is called from within an existing tikz environment with the remember, overlay options active, allowing for page coordinates (i.e. current page.north) to be used.

The default part command allows a user to specify a background image for their part page -- it is not necessary to provide one within the drawing command.

### **Dice Commands**

Dice are a mainstay of RPGs, and so it is important to have a standard way to report and simplify their expressions. We provide an interface for a standard `dice + modifier' expression.

#### \RpgDice

{m}

Evaluates expressions of the form  $ndx \pm m$ , and outputs using a theme-dependent layout.

#### **Syntax**

\RpgDice {<dice-expression>}

#### Details

Uses regular expressions to extract and simplify the dice-expression, which must follow the following format:

Dice format	
1. It must contain either `d' or `D' (the `dice symbol')	either the dice count (if present) or the dice symbol
2. The dice symbol must be immediately followed by a single number (the `dice size')	5. The dice size must be followed by either a `+', '-', or the end of the expression.
3. The dice symbol may optionally be prefixed by a single number (the `dice count')	6. After this, any number of standard numeric expressions may follow. This expression will
4. The first (non-whitespace) character must be	be evaluated into a single `modifier'.

The dice ignores any whitespace before the beginning of the expression, and arbitrary whitespace within the `modifier' part of the expression.

Output
1d6-2
2d6+12
1d16
d8-3
(Fails to compile)
1

RpgDice is neat, but not necessarily impressive by itself. The true power of the expression is that it calls RpgDiceFormat to perform the output formatting (after performing the regular expression parsing), allowing designers to customise their dice formatting.

RpgDice is loaded in both layout and non-layout calls.

# \RpgDiceFormat {m m m}

Prints the values computed by RpgDice

#### Syntax

\RpgDiceFormat {<dice-count>}{<dice-size>}{<added bonus>}

#### Details

This is a Placeholder Command, used by theme designers to determine how RpgDice is rendered. The default option is:  $\RpgDiceFormat \{m m m\} \{ \#1d\#2 \#3 \}$ , such that RpgDice $\{ndx + a + b\}$  gives ``ndx + c'', where c is the numerical value of a+b, with an additional check to see if #3 is equal to 0, in which case it is not printed (so as not to `1d6 + 0').

The dnd implementation performs a more advanced operation, computing the average value of the roll, and formatting that first, to replicate the format used by monster stat blocks.

Example (with \RpgSetTheme {dnd})	Output
\RpgDice {1d6-2}	1 (1d6-2)
\RpgDice {2D6 + 3*2^2}	19 (2d6+12)
\RpgDice {1d12}	6 (1d12)
\RpgDice {d83-3}	39 (d83-3)

#### Theme Commands

#### \RpgLayoutOnly

 $\{m\}$ 

Executes the contents of the command if layout mode is active.

#### **Syntax**

\RpgLayoutOnly {<content-to-execute>}

#### **Details**

If the internal value \l\_\_rpg\_layout\_bool is True, then content-to-execute is run, otherwise it is ignored.

This command is primarily used by theme developers and document class files to conditionally load or activate modules based on whether the package was loaded via a document class (layout mode active) or directly via \usepackage {rpgtex}.

#### \RpgSetTheme

{m}

Activates a chosen theme.

#### **Syntax**

\RpgSetTheme {<theme-name>}

#### **Details**

Searches for the file <theme-path>/<theme-name>.cfg, and inputs it. If this is a properly configured theme file, then it activates the chosen theme given the current global parameters. If the file does not exist, throws an error.

If \l\_\_rpg\_layout\_bool is True, the command automatically inserts \clearpage, as required to ensure the old headers are not overwritten by the new theme.

<theme-path> is modified via RpgSetThemePath.

#### \RpgSetThemeColor

{m}

Sets the themecolor, and simultaneously updates the co-varying colors (page 12).

#### Syntax

\RpgSetThemeColor {color-name}

#### Details

If color-name specifies a valid color, then the value of themecolor is updated, as well as a number of other colors (tipcolor, sidebarcolor and tablecolor) which are set to be equal to the themecolor by default.

Of the rpg-provided colors, only narrationcolor is unaffected by this command.

#### \RpgSetThemePath

{m}

Changes the value of the theme path searched for by RpgSetTheme

#### Syntax

\RpgSetTheme {<path-name>}

#### Details

Updates an internal variable to be equal to the input value; does not check if the theme path is valid or not. Useful if you wish to create a new theme outside of the rpgtex file structure.

\RpgSetFont

See page 13

## **Utility Commands**

#### $\RpgOrdinal$

 $\{om\}$ 

Converts a numeric value to the corresponding ordinal.

#### Syntax

\RpgOrdinal [<command>]{<count>}

#### Details

The command outputs the count followed by the english abbreviations for the corresponding ordinal. The optional command argument is inserted between the numeral and the suffix, allowing for the customisation of appearances.

Example	Output
\RpgOrdinal {1}	1st
\RpgOrdinal {2}	2nd
\RpgOrdinal {13}	13th
\RpgOrdinal [\textsuperscript ]{7}	$7^{ m th}$
\RpgOrdinal [\textbf ]{133}	133 <b>rd</b>
\RpgOrdinal [ <arbitrary text="">]{133}</arbitrary>	133 <arbitrary text="">rd</arbitrary>

Note that due to a lack of brace-capturing, it is not possible to chain multiple commands..

# \RpgPage {0{t} m}

Outputs the current page reference for a label, with an option to enclose it in specific brackets or parentheses.

#### **Syntax**

\RpgPage [t/p/b/c]{<label-reference>}

#### **Details**

The optional arguments wrapping of the main reference. The options are:

- t (default) No wrapping
- **p** (parentheses)
- **b** [square brackets]
- c {curly braces}

An invalid input resolves to ?page~\pageref {<ref}?.

Example	Output
\RpgPage {example:current page}	page 9
<pre>\RpgPage [p]{example:current page}</pre>	(page 9)
\RpgPage [b]{example:current page}	[page 9]
<pre>\RpgPage [c]{example:current page}</pre>	{page 9}
<pre>\RpgPage [(error)]{example:current page}</pre>	?page 9?

#### \RpgPlural

{o m m}

Generates grammatically correct plural forms of a word based on a given count.

#### **Syntax**

\RpgPlural [<custom-plural>]{count}{<text>}

#### Details

The command outputs the count followed by the value of <text>. For a count of 1, the command then finishes. For any other count, it appends an ``s'', pluralizing the text.

The optional argument [<custom-plural>] overrides the default logic, allowing for irregular plurals.

Example	Output
\RpgPlural {1}{hat}	1 hat
\RpgPlural {2}{hat}	2 hats
\RpgPlural [octopodes]{1}{octopus}	1 octopus
\RpgPlural [octopodes]{359}{octopus}	359 octopodes

# Chapter 3: Environments

RpgNarration RpgSidebar RpgTable RpgTip

# Chapter 4: Variables

# Colo(u)rs

rpgtex by default defines a number of colors<sup>1</sup> which are used for different elements:

themecolor A `basic color' which is (by default) equal to the following three colors:

- 1. sidebarcolor The background color of the RpgSidebar environment
- 2. tablecolor The background color of every other row in an RpgTable
- 3. tipcolor The background color of the RpgTip environment

narrationcolor The background color of the RpgTip environment

contourinnercolor The default color of the inner text within a RpgContour command

contouroutercolor The default color of the external contour drawn around text within a RpgContour command.

Calling \RpgSetThemeColor (page 8) updates the value of themecolor, as well as the three `co-varying' colors (i.e. everything except narrationcolor). When printmode is active \RpgSetThemeColor{white} is called, making environments transparent.

<sup>&</sup>lt;sup>1</sup>Yes, I hate myself, but we're going with the code-based spelling.

# Chapter 5: Fonts

rpgtex allows for a high degree of customisation of the fonts and typefaces used for the elements within a document. The key interface for the designer is the \RpgSetFont command, which accepts a wide variety of key-value inputs, detailed below.

#### Font Interface

\RpgSetFont

{m}

Saves new font values and styles to the internal RpgFont[X] variables, which are then available for themes to use.

#### Syntax

\RpgSetFont {<key-value-pairs>}

#### Details

Note that this interface does not automatically change all fonts. The SetFont-interface saves values to internal variables which populate the corresponding RpgFont[X] macros. It does not invoke fontspec and does not automatically assign fonts to the designated elements. However, a theme designer may then use the RpgFont[X] macros within their commands, thereby assigning fonts to the relevant elements. In this case (or if a user manually invokes a font), this command will act to update the font.

To summarise: if a writer uses a theme which does not make use of the RpgFontSection font, then calling RpgSetFont{section-style=\it} will have no effect. They would need to set \titleformat {\section} { \RpgFontSection }{}} (titlesec is loaded by default), in which case calling RpgSetFont would change the font for all subsequent calls to \section.

The exception to this is the main-body font, which is achieved by updating \normalfont.

#### Defining Fonts

The arguments passed to the `style' can be any form of latex formatting (i.e. \slshape\scriptsize\bfseries, and so on). To update the typeface, however, you must define a font family:

```
\newfontfamily{\myfont}{arial}
\RpgSetFont{main-body-family=\myfont}
```

For custom typefaces - or where you wish to `mix and match' typefaces in different modes, you can use the full power of the fontspec package :

```
\newfontfamily{\myfont}{custom-font}[
Path=/path/to/local/font.otf,
ItalicFont=*-Bold,
BoldFont=Arial,
]
\RpgSetFont{main-body-family=\myfont}
```

This would define a font which used a local .otf file for the main font, but the bold typeface when \textit{} were called, and used arial as the mock `boldface'.

#### Font Elements

rpgtex provides 28 Font Commands, each comprised of a family and a style.

#### Family vs Style

When defining the Font for an element, the interface allows one to specify both a family and a style. Formally speaking, family defines the typeface used by the associated element, whilst the style determines the options passed to that typeface (bold, italics, size etc.).

The distinction is largely irrelevant, as the construction of the final font object is often simply the concatenation of the two:

```
\def\RpgFontX
{
   \l__rpg_x_family \l__rpg_x_style
}
```

The separate definitions is therefore largely a matter of clarity and readability. It is generally safe to place commands that should be in family into the style key, as long as it doesn't conflict with other styling.

#### Font vs Implementation

We generally encourage designers to place all text visualisation within the relevant Font rather than elsewhere -- if all subsections are going to be in red, then define subsection-style=\color{red}, rather than setting it within the titlesec specification (\titleformat {\subsection}{\RpgFontSubsection\color{red}}...).

There will naturally be some exceptions to this: we found that the RpgTitleFont colour we wanted within RpgDrawCover diverged so strongly from that in RpgSimpleTitle that it made sense to define a special colour when rendering over a background image.

These fonts are assigned to typesetting elements by the theme designer -- what we have intended to be the section font may, within a different theme, be used for a different element. This document outlines how we have used these elements in the provided themes, though this is not prescriptive.

Font Element \RpgFontBody	Values main-body-family main-body-style	Usage The main body text of the document, which RpgSetFont sets equal to \normalfont. Updating the fontsize here (i.e. using \large) can cause some counterintuitive results since it will only update the body text, and not adjust the other elements relatively. Adjusting the font size for the entire document should be done in the documentclass declaration.
\RpgFontTitle	title-family title-style	The font used for \@title when \maketitle is called.
\RpgFontSubtitle	subtitle-family subtitle-style	The font used for the value of \@subtitle (page 5), \@author and \@date when \maketitle is called.
\RpgFontPart	part-family part-style	The font used when \part is called.
\RpgFontTocPart	toc-part-family toc-part-style	The font used for a part in the table of contents
\RpgFontChapter	chapter-family chapter-style	The font used when \chapter is called.

\RpgFontTocChapter	toc-chapter-family toc-chapter-style	The font used for a chapter in the table of contents
\RpgFontSection	section-family section-style	The font used when \section is called.
\RpgFontTocSection	toc-section-family toc-section-style	The font used for a section in the table of contents
\RpgFontSubsection	subsection-family subsection-style	The font used when \subsection is called.
\RpgFontSubsubsection	subsubsection-family subsubsection-style	The font used when \subsubsection is called.
\RpgFontParagraph	paragraph-family paragraph-style	The font used when \paragraph is called.
\RpgFontSubparagraph	subparagraph-family subparagraph-style	The font used when \subparagraph is called.
\RpgFontTableTitle	table-title-family table-title-style	The font used for <text> if \RpgTable (page 11) is called with the title=<text> option.</text></text>
\RpgFontTableHeader	table-header-family table-header-style	The font used for the first row of a \RpgTable.
\RpgFontTableBody	table-body-family table-body-style	The font used for the text within an <b>\RpgTable</b> after the first row.
\RpgFontTipTitle	tip-title-family tip-title-style	The font used for the title of an RpgTip environment (page 11).
\RpgFontTipBody	tip-body-family tip-body-style	The font used for the body of an RpgTip environment (page 11).
\RpgFontSidebarTitle	siderbar-title-family siderbar-title-style	The font used for the title of an RpgSidebar environment (page 11).

\RpgFontSidebarBody	sidebar-body-family sidebar-body-style	The font used for the body of an RpgSidebar environment (page 11).
\RpgFontNarration	narration-family narration-style	The font used for all (since they have no title) of an RpgNarration environment (page ??).
\RpgStatBlockTitle	stat-block-title-family stat-block-title-style	The font used for the title of a `statblock' environment - in the dnd theme this corresponds to the monster environment.
\RpgStatBlockSection	stat-block-section-family stat-block-section-style	The font used for sections within a `statblock' environment (should one be defined).
\RpgStatBlockBody	stat-block-body-family stat-block-body-style	The font used for text within a `statblock' environment (should one be defined).
\RpgFontFooter	footer-family footer-style	The font used for the footer text
\RpgFontPageNumber	page-number-family page-number-style	The font used for the page number within the footer
\RpgFontDropCap	<pre>drop-cap-family drop-cap-style</pre>	The font used for the large drop-cap letter created by a RpgDropCap (see below).
\RpgFontDropCapInternal	<pre>drop-cap-internal-family drop-cap-internal-style</pre>	The font used for the first line of text following the drop cap.

### **Decorative Text**

In addition to the fundamental typeface alterations rpgtex includes a number of commands to turn text into decorative elements.

\RpgContour {O{} m}

Renders text with a **contour effect**. The color and style are set through key/value pairs.

#### **Syntax**

\RpgContour [inner=<color>,outer=<color>,style=<code>]{<text>}

#### Details

The style command is applied to the text, whilst the optional inner and outer commands set the base text colour and the external contour color respectively. If the colors are not set, the default values are the contourinnercolor and contouroutercolor values defined by the theme (page 12). The contour does not automatically linebreak, but can be controlled manually with a \newline command (not \\ or \par)

Example	Output
\RpgContour [inner=red,outer=black]{example}	example
<pre>\RpgContour [style=\Huge \it ]{example}</pre>	example
\RpgContour []{multi\newline line\newline example}	multi line example

#### Quirks

Due to the tokenisation required for the line-splitting and space-preservation, the text inside the contour can exhibit some quirks if stylisation is applied within the <text> argument.

Unbraced commands (such as \it or \footnotesize) will only apply to the first word in the text. Braced commands can work, but will cause a compilation error if a \newline is included.

\RpgContour []{\Huge \it only first word changes}	only first word changes
<pre>\RpgContour []{\textit {all words change}}</pre>	all words change
<pre>\RpgContour []{\textit {all word \newline change}}</pre>	(fails to compile)

For robustness, we therefore recommend that all stylisation be applied through the style command, which is applied to each tokenised element, and therefore guaranteed to work as expected.

\RpgDropCap
{0{}, m m}

Creates a decorative 'drop cap' letter to begin a new chapter with, and modifies the following text.

#### **Syntax**

\RpgDropCap [<lettrine-args>]{<letter>}{<text>}

#### **Details**

This command uses the lettrine package and the magaz package to create an easy-to-use environment in which the first letter is enlarged (and stylised in the RpgFontDropCap font). The second argument formats *up to the first line* of text in the RpgFontDropCapInternal font (usually a simple scshape command).

This command can be a little fragile -- lettrine does not usually play well with the `FirstLine' command provided by magaz -- and we've used a few workarounds to allow both linebreaking, and the formatting of only the first line of text. There may need to be a small amount of manual calibration, but it is better than the default.

#### Example

\RpgDropCap {A}{n example: \blindtext }

#### Output

N EXAMPLE: LOREM IPSUM DOLOR SIT AMET, consectetuer adipiscing elit. Etiam lobortis facilisis sem. Nullam nec mi et neque pharetra sollicitudin. Praesent imperdiet mi nec ante. Donec ullamcorper, felis non sodales commodo, lectus velit ultrices augue, a dignissim nibh lectus placerat pede. Vivamus nunc nunc, molestie ut, ultricies vel, semper in, velit. Ut porttitor. Praesent in sapien. Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Duis fringilla tristique neque. Sed interdum libero ut metus. Pellentesque placerat. Nam rutrum augue a leo. Morbi sed elit sit amet ante lobortis sollicitudin. Praesent blandit blandit mauris. Praesent lectus tellus, aliquet aliquam, luctus a, egestas a, turpis. Mauris lacinia lorem sit amet ipsum. Nunc quis urna dictum turpis accumsan semper.
